THE MANUFACTURING CHALLENGE

PRECISION NEEDS PROOF.

A technically successful AI operation can still produce the wrong manufacturing outcome. HAIEC independently evaluates evidence around consequential actions, not model opinion.

CASE STUDY / STATION 217

SUCCESS ON THE WRONG WORK ORDER

APPROVED TARGET	API RESPONSE	RECORDED TARGET
WO-217-4802	200 OK	WO-217-4803

REVIEW

MFG-EFF-001 MATCH: qualified synthetic evidence shows a wrong-target record readback; wider authority remains unresolved.

EVIDENCE IN THE REFERENCE CORPUS

9
manufacturing systems
synthetic estate

45
saved evaluations
nine x five states

9 / 9
wrong-target examples
expected rule match

All 45 evaluations have a REVIEW disposition. These are deterministic HAIEC evaluations of synthetic records, not live factory runs or production detection accuracy.

INTERACTIVE DIGITAL FACTORY

MES
Work-order holds and advisory choices

ERP
Financial and supplier qualification gates

EQUIPMENT
Virtual anomaly and signal-loss observations

WHAT THE DEMO ESTABLISHES

An API success is not proof of the correct business effect. The demo reveals that difference without claiming live industrial control or production certification.

A CLOSER LOOK AT THE EVIDENCE

WHAT HAPPENED? WHAT IS PROVEN?

A scoped wrong-target rule can establish a mismatch while broader action-path, identity, deployment and completeness questions remain unresolved.

FIVE EVIDENCE PLANES

REQUESTED	POLICY	GRANTED	CAPABLE	OBSERVED
What was asked?	What was approved?	What access exists?	What can code reach?	What did evidence show?

STATION 217: RULE OUTCOMES

MFG-EFF-001	**MATCH**	Wrong-target effect evidence
MFG-EFF-002	**INSUFFICIENT**	Collector continuity absent
MFG-OBS-001	**INSUFFICIENT**	Observation completeness unresolved

Overall evaluation: REVIEW. The synthetic case supports a specific target mismatch, not a blanket claim of full authority, safety or production prevention.
